

NEW INSCO

CANADA

La combinaison de la gravimétrie, MAG et EM peut être une approche gagnante pour les cibles de VMS. Car ceux-ci sont denses, conducteurs et sont souvent associés à des minéraux magnétiques.

New InSCO is a moderately dipping, tabular Cu-Zn VMS type deposit located within the Abitibi greenstone belt.

A MAG survey successfully detected an anomaly with a strong, discrete peak.

HLEM yielded a good response over the sulphide mineralisation and associated graphitic horizon.

Gravimetry was successful in discriminating the density contrast between sulphides and the graphitic horizon.
