

LAC PORPHYRE

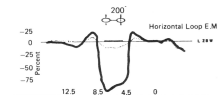

CANADA

Une réponse géophysique typique d'une lentille en sulfure verticale.

 The Porphyre Lake deposit is a barren massive sulphide deposit in the Matagami Mining Camp, North Western Quebec, Canada.

 A well defined 2 mgal residual Bouguer anomaly is associated with the sulphide lens.

 A 1000 gamma magnetic anomaly also marks the location of the lens.

 The Sulphide lens produces a classical FDEM (HLEM) profile for a subvertical conductor.
